RandomUser Data Ingestion

RandomUser

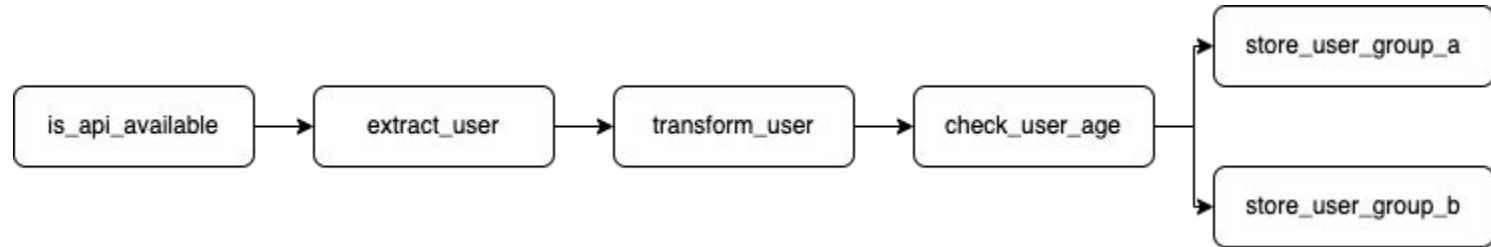

Background

Our business team needs user data generated by RandomUser. They need the following information: first name, last name, gender, age, country, and email. They expect one new user every minute. They also want to separate user data with age ≥ 30 and age < 30 . Help business teams provide data in table format (CSV)!

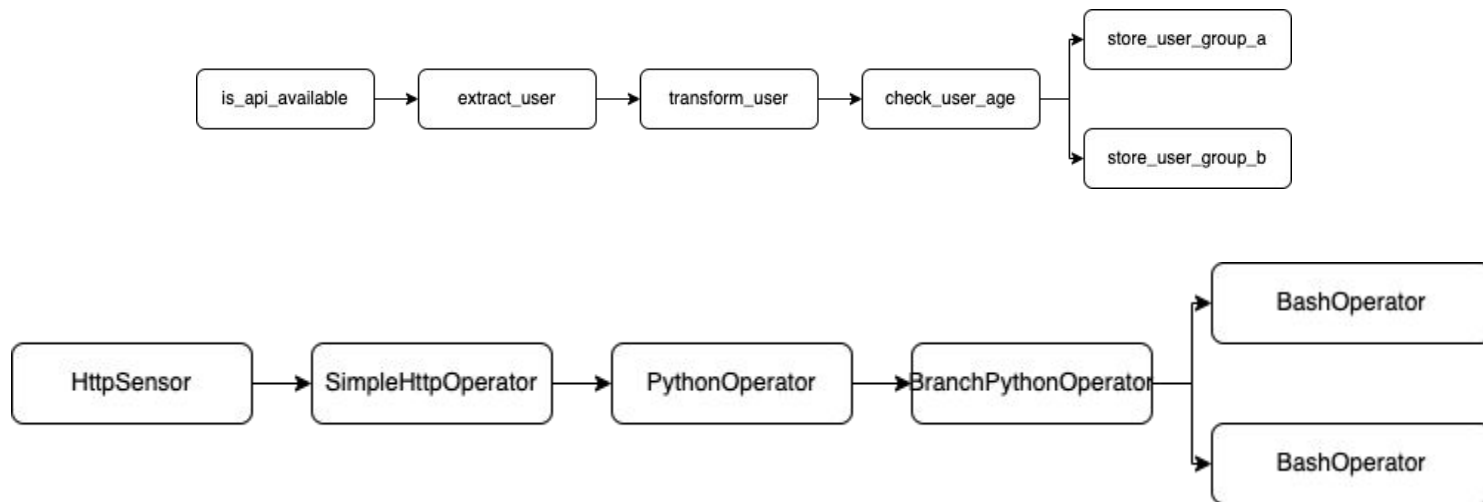

RandomUser API

You can access the user information from the API: **<https://randomuser.me/api>**

Workflows

Tasks

Thank you!

See you in the next session 💪
